

# Premier has partnered with NavCare to offer remote patient monitoring (RPM) with option to add comprehensive care management (CCM) and a telemedicine platform.

## How NavCare stands out:

### ✓ Clinical Team

Our team is staffed with quality providers - RNs, LPNs, CMAs - who review vitals and outreach to provide care coordination

### ✓ Access

Our care team is available 24/7 for any patient needs

### ✓ Support

Our team helps providers to focus on the patients who need their attention the most. Many RPM companies only provide devices. Our solution takes the burden off the provider and clinic staff by providing both monitoring and device inventory.

## Highlights

- The option to bundle RPM, CCM, and telemedicine supports well-coordinated disease management and visit scheduling. Providers can sign up for all services or choose the ones that best fit the practice's needs.
- Devices operate through cellular towers, so patients with limited access to internet or smartphones can still engage in RPM, CCM, and telemedicine visits with their own PCP.
- NavCare individualizes the program to fit each practices' specific needs, including alert preferences and EMR integration.
- All the platforms are HIPAA compliant, easy to use, and offered at a competitive price.

## FEATURES

What is included?

### Provider and Patient Facing Features

### Emergency Button

A secure connection to clinical support 24/7

### Proactive Messaging

Appointment and medication reminders to increase adherence to treatment plans

### Condition-Specific Content

Health and wellness videos to support patients and caregivers

### Reporting

Real-time vitals and trends dashboard to give providers actionable data

## Why implement this program now?

As a result of COVID-19, practices are seeing lower visit volumes and revenue. RPM and/or CCM brings additional fee-for-service revenue to your practice now and can increase shared savings.

RPM devices allow providers to obtain vitals adding more value to telemedicine visits.

Engaging patients in RPM can reduce hospital stays, avoid readmissions, and improve chronic disease management.

Extended care team's frequent contact and monitoring helps to identify which patients need to be scheduled for a visit.
